WHAT IS PIPE RELINING?

When you have damaged pipes, there are two main repair options, a Traditional Pipe Repair, and the new technology of Pipe Relining.

A Traditional Pipe Repair consists of extracting the damaged section of pipe and replacing it with a new piece of piping. This usually involves excavating to gain access to the pipes, multiple technicians and a lot of landscaping. The latest option is Pipe Relining, a state-of-the-art technology which can fix cracked, leaking and blocked pipes without excavating or digging up your yard.

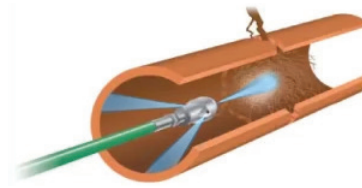

BENEFITS OF PIPE RELINING

- ✓ PERMANENT FIX
- ✓ NO DIGGING
- ✓ LESS NOISE THAN EXCAVATION
- ✓ 50 YEAR LIFE EXPECTANCY
- ✓ SAVE TIME AND MONEY ON UNNECESSARY LANDSCAPING

WHAT WE DO

1. Pipes are inspected with the **latest CCTV equipment** to locate and diagnose the problem.

2. Pipe is prepared for relining using a **high-pressure jet blaster**.

3. **A packer is inserted into the damaged pipe**, the liner is pulled into place and inflated, forcing the liner against the wall of the pipe.

4. After the liner has cured, **the host pipe is structurally repaired** and a final CCTV inspection is carried out on the renewed pipe.

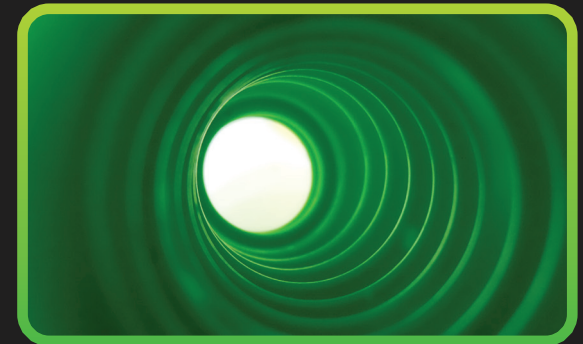

You now have a permanent fix and good as new pipes!

SAY GOODBYE TO PROBLEM PIPES FOR GOOD!

BEFORE

This CCTV inspection was carried out on a blocked sewer line heavily infested with tree roots and debris.

AFTER

After a Pipe Relining, the pipe is totally clear. The sewer is now totally renewed, resulting in improved water flow and future protection from tree roots and debris.
